Forest History in Japan under changing environment

Takayoshi KOIKE

Silviculture & Forest Ecological Studies, Hokkaido University, Sapporo, Japan

Contents

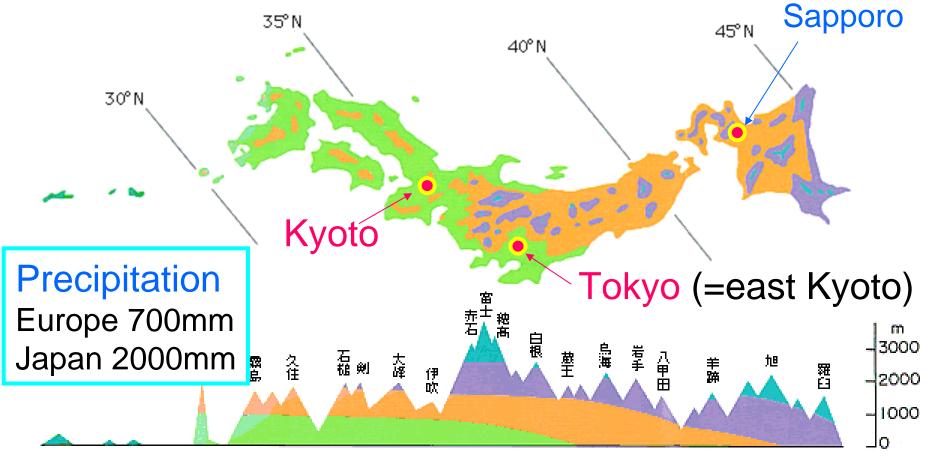

1) Vegetation characteristics of Japanese Forests

2) Brief history of Japanese forestry from the view point of Prof. Conrad D. Totman and Prof. M. Kumazaki

3) After Prof. C. Totman -Current view of Japanese forestry-

4) Conclusion

Vertical and horizontal distribution of Japanese forests

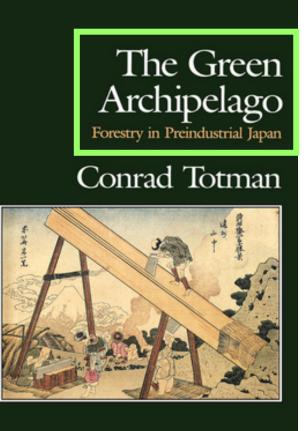

- Sub-frigid/alpine forests
- Conifer forests
- Cool temperate forests

- Warm (laurel) temperate forests
- Sub tropical forests

Based on the history of Japanese forestry shown in

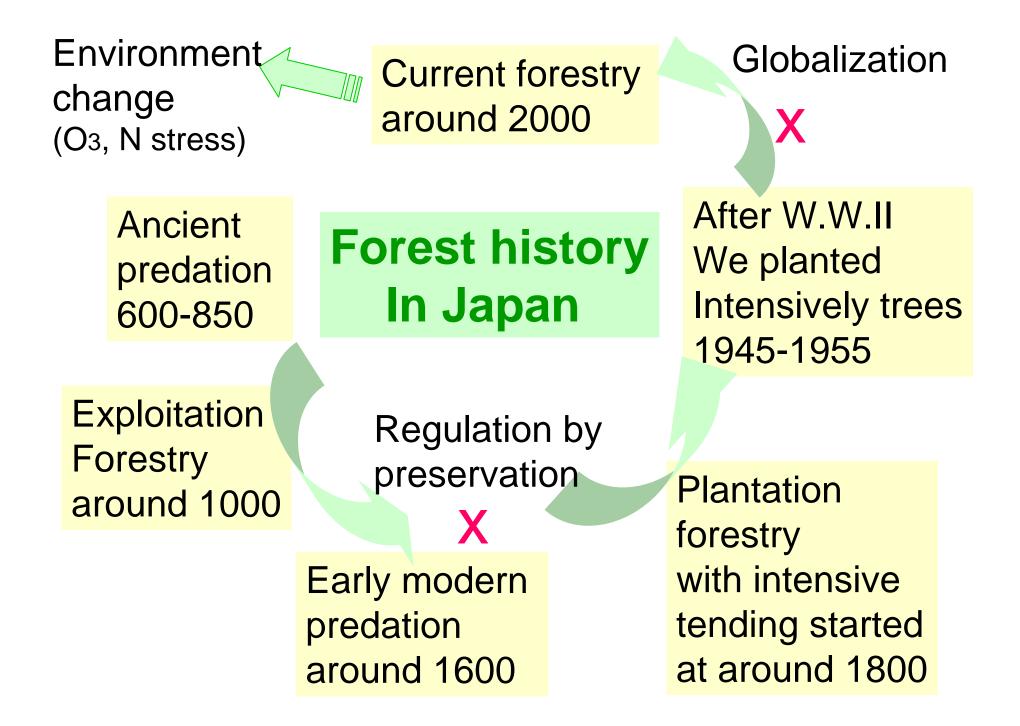

Professor Minoru Kumazaki (The Univ of Tsukuba Japan)

Professor Conrad Tatman (Yale University U.S.A.)

The illustration shows the activities of carpentry

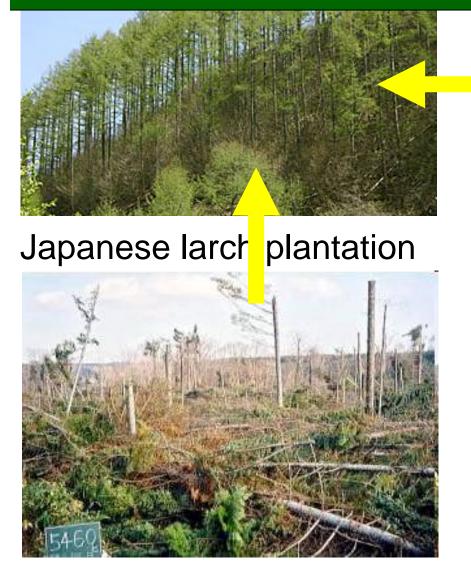

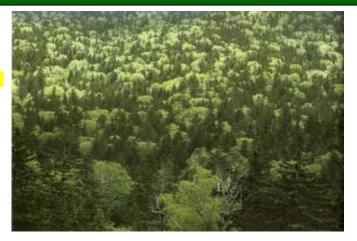

Intensive tending for producing high quality woods in Kyoto

8

Original vegetation of Hokkaido, mixed forest

Typhoon attacked in 1954, 2004

After W.W.II, we had transplanted from secondary broad-leaved to confers;

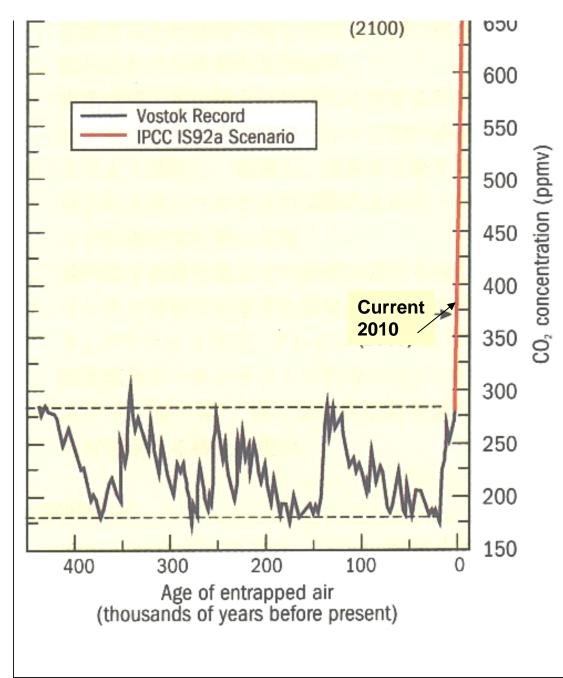

e.g. the trace of man-made larch forests are the shape of Hokkaido.

 After severe typhoon damages, we simulate to make a forest to the original type mixed forest.

Current situation:
no tending was carried out
due to the globalization.
Plantation forestry faces
now severe difficulties.

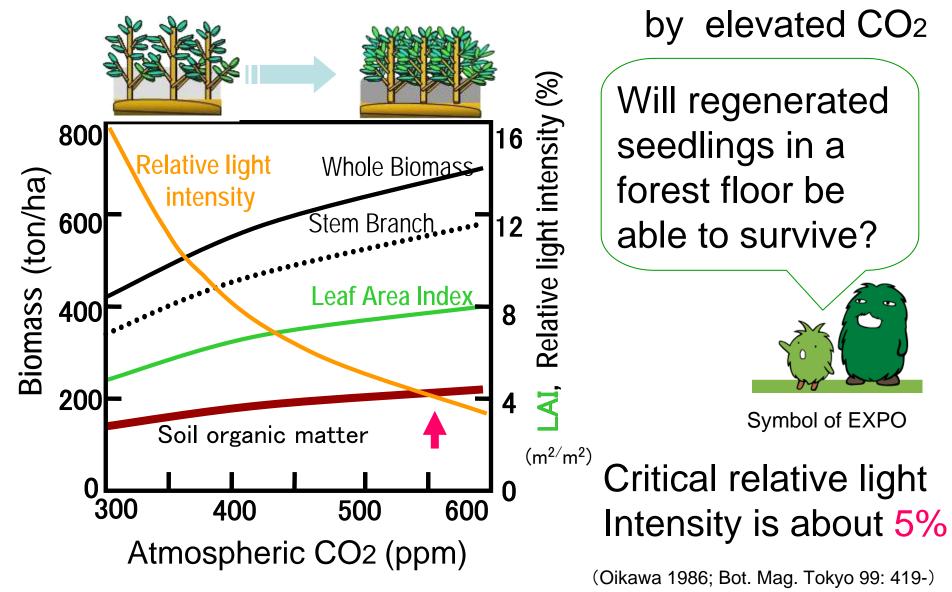

We should make new forestry under changing environment, e.g. elevated CO₂, ozone, and high nitrogen deposition.

What can we do for overcoming these difficulties?

High CO₂ affecting the structure of a forest (Biodiversity)

Shoot development of upper layer will be increased

Conclusion

- 1) Ancient predation: forests recovered naturally soon.
- 2) Exploitation Forestry: people had started the overuse of forest resources and consequently the surrounding mountains became naked in Kyoto.
- Early modern predation: *Hideyoshi Toyotomi* was the first person who could manage woods in whole Japan; following *Tokugawa-shugun* to build castles, temples, shrines to show power.
- 4) To keep forest resources, plantation forestry with intensive tending saved forests with green at1800.
- 5) Under globalization, most man-made forests have been discarded without tending....
